The Da Vinci is designed to deliver exceptional convection heat through its outer chamber, allowing air to rise and disperse into the environment through top dome openings. Its exterior ashpan ensures ample airflow during initial combustion and refueling, with controllable knobs regulating primary air to the combustion chamber. Paired with stone firebricks, the ashpan encourages the use of anthracite for efficient burning. For secondary combustion, a control lever below the ashpan manages airflow. This secondary air is preheated through vents passing over the combustion chamber. As it flows over the viewing glass, it acts as an air-wash system, preventing soot buildup and ensuring a clear view of the flames.
